ENGINEERING DRAWING · ADR 0004

AGENTLORE · SECOND BRAIN

The upper lane records every session, like a diary. The lower lane draws from that diary what is worth remembering about each project, and loads it into the next session. Look up the circled numbers in the parts list.

PARTS LIST

NO.	PART	IN THE BRAIN	SPECIFICATION
1	Working sessions	experience	Claude Code, Codex, Cursor, Antigravity; many sessions at once, across many repositories
2	Transcripts on disk	the senses	written by each tool; agentlore only reads them
3	lore index	encoding	reads only what is new; passwords, tokens and keys are redacted before anything is stored; runs when a session ends, and a search refreshes an index older than 10 minutes
4	index.db	hippocampus	SQLite FTS5, BM25 plus optional multilingual vectors; keeps chats a tool deleted (archive); readable by you only
5	remember (MCP)	deliberate memorizing	the agent saves while it works; reads with recall first and merges; one topic per call; redacted
6	Stop hook	a reminder to oneself	asks as soon as you make a decision, and after every ~250 KB of new transcript; never twice in a row; not when the agent just saved a note
7	lore consolidate	consolidation in sleep	opt-in daily job; claude -p with sonnet, no tools, no MCP, no session saved; 5 projects a run, 60,000 characters each; uses your Claude quota
8	Project memory	cortex	editable Markdown; brief ≤ 2,000 characters, topics ≤ 6,000, at most 20; last 10 versions kept; never touched by a rebuild
9	groups.json	association	lore group add links one customer's repositories; their briefs come along
10	MCP server	active recall	search 3 short hits, context full text, recall, remember; notes rank above chats (×1.5)
11	SessionStart hook	priming	≤ 2,800 characters (~700 tokens): the brief, the topic list, related projects; plus the user profile (≤ 1,500), in any project
12	Prompt hook	cued recall	≤ 900 characters, only when clearly related; includes this project's other sessions; says which notes changed since the last prompt
13	New session	someone who knows the job	starts out knowing; looks up details; saves what it learns for the next one

1. **No session has to know everything.** Each saves what it learned; the nightly pass catches the rest.
2. **Notes are written by AI and can be wrong or stale.** Each says who wrote it and when, and agents are told to check it against the code.
3. **Everything stays on your machine.** Only part 7 sends redacted excerpts to Claude, through your own Claude Code.

LEGEND

- ——— data flows
- ------- reads, never writes
- - - - asks the agent to act
- ▭ safety gate, or uses quota
